GREAT INDIAN AI INTERNSHIP CHALLENGE | 2026

SHRAVAN

Local issues are easy to spot. Clear reporting should be easier.

BUILT BY SASIDHAR PALURI

SHRAVAN helps residents prepare a clear local-issue report by speaking or typing, reviewing the wording, adding a category and approximate area, then saving or choosing to share it.

THE PROBLEM

English-first forms and typing can add friction when residents want to describe a pothole, water issue, waste problem, drainage concern, or broken streetlight. A clear report takes more than spotting the issue.

THE APPROACH

SHRAVAN is a multilingual, voice-first civic-reporting prototype. It turns a voice note or typed description into an editable report that stays under the resident's control.

WHO IT SERVES

Residents preparing a report to share with a ward desk or community group, especially people who would rather speak in an Indian language than type a long description.

RESIDENT CONTROL

Every transcript is editable. Residents choose the read-back language, review details before saving, and decide whether to share a clearly labeled summary.

10 LANGUAGE CHOICES

Hindi, Indian English, Bengali, Tamil, Telugu, Marathi, Gujarati, Kannada, Malayalam, and Punjabi.

HOW IT WORKS

1. Choose a supported language or auto-detect code-mixed speech.
2. Record up to 30 seconds, preview it, and request transcription, or type instead.
3. Review and edit the transcript; add an issue category and approximate public landmark.
4. Hear the report read back, save it in the browser, and optionally share a labeled summary.

GNANI AI IN THE LOOP

Prisma v2.5 transcribes selected-language speech. Prisma v3.0 handles automatic language detection and code-mix in the Telugu-English demo path. Timbre v2.5 reads the reviewed report back in a chosen supported language.

TECHNICAL DESIGN

Next.js server routes call Gnani and keep the API key out of browser code. The browser stores up to ten reports; audio is not attached to saved reports.

WHAT IS BUILT TODAY

A working local-first flow with manual sharing. There is no account system, shared database, civic-authority endpoint, official tracking number, or Evon integration.

PROTOTYPE STATUS AND NEXT STEP

The demo uses synthetic Telugu-English audio and illustrative pothole content. It demonstrates the reporting flow; it does not claim field validation or completed civic action. Next: conduct consent-based usability sessions with residents and community partners, then refine the flow from their feedback.

Gnani AI: Prisma v2.5 / v3.0 | Timbre v2.5 | Next.js + React + TypeScript
